INSTALL A SIGN ON YOUR SODIUM HYPOCHLORITE SYSTEM

The Chlorine Institute Recommends Placing Signs on Sodium Hypochlorite Unloading Lines

The Chlorine Institute's Sodium Hypochlorite Committee recommends that all sodium hypochlorite unloading lines be equipped with a sign to notify truck drivers. It should be brief and to the point. The following is recommended:

Sodium Hypochlorite Only (Bleach) UN1791

The signs should be large enough to be visible from at least ten feet away. The Institute also suggests that storage sites consider having stickers printed with the same wording and placing them on the actual sodium hypochlorite piping.

These steps are recommended to help eliminate the accidental mixing of sodium hypochlorite solutions with other chemicals causing potentially dangerous reactions and reaction products. Also see the other CI sodium hypochlorite information on our website for suggestions for reducing accidental mixing.
